

Link layer, LANs: outline

6.4 LANs

- addressing, ARP
- Ethernet
- switches
- VLANs

6.5 link virtualization: MPLS

6.6 data center networking

6.7 a day in the life of a web request

Link Layer and LANs 6-1

1

VLANs: motivation

consider:

- CS user moves office to EE, but wants connect to CS switch?
- single broadcast domain:
 - all layer-2 broadcast traffic (ARP, DHCP, unknown location of destination MAC address) must cross entire LAN
 - security/privacy, efficiency issues

Link Layer and LANs 6-2

2

VLANs

Virtual Local Area Network

switch(es) supporting VLAN capabilities can be configured to define multiple **virtual** LANS over single physical LAN infrastructure.

port-based VLAN: switch ports grouped (by switch management software) so that **single** physical switch

... operates as **multiple** virtual switches

Link Layer and LANS 6-3

3

Port-based VLAN

- **traffic isolation:** frames to/from ports 1-8 can **only** reach ports 1-8
 - can also define VLAN based on MAC addresses of endpoints, rather than switch port
- **dynamic membership:** ports can be dynamically assigned among VLANs
- **forwarding between VLANs:** done via routing (just as with separate switches)
 - in practice vendors sell combined switches plus routers

Link Layer and LANS 6-4

4

VLANs spanning multiple switches

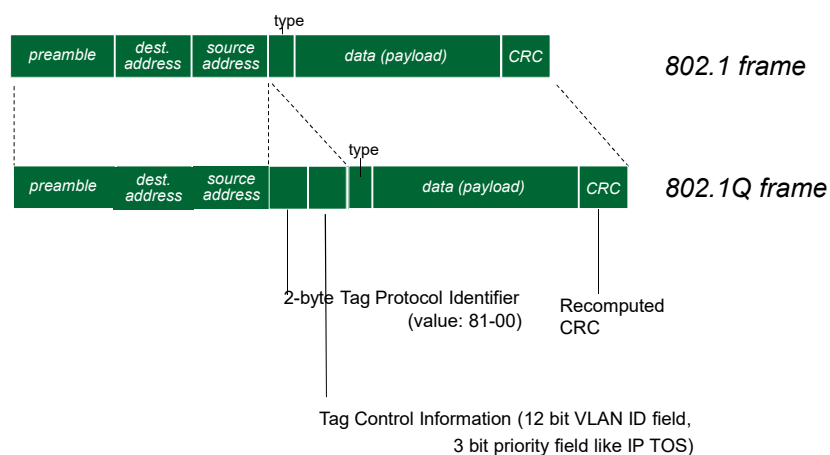

- **trunk port:** carries frames between VLANs defined over multiple physical switches
 - frames forwarded within VLAN between switches can't be vanilla 802.1 frames (must carry VLAN ID info)
 - 802.1q protocol adds/removed additional header fields for frames forwarded between trunk ports

Link Layer and LANs 6-5

5

802.1Q VLAN frame format

Link Layer and LANs 6-6

6

Multiprotocol label switching (MPLS)

- initial goal: high-speed IP forwarding using fixed length label (instead of IP address)
 - fast lookup using fixed length identifier (rather than shortest prefix matching)
 - borrowing ideas from Virtual Circuit (VC) approach
 - but IP datagram still keeps IP address!

Link Layer and LANs 6-7

7

MPLS capable routers

- a.k.a. label-switched router
- forward packets to outgoing interface based only on label value (*don't inspect IP address*)
 - MPLS forwarding table distinct from IP forwarding tables
- **flexibility:** MPLS forwarding decisions can *differ* from those of IP
 - use destination *and* source addresses to route flows to same destination differently (traffic engineering)
 - re-route flows quickly if link fails: pre-computed backup paths (useful for VoIP)

Link Layer and LANs 6-8

8

MPLS versus IP paths

- **IP routing:** path to destination determined by destination address alone

Link Layer and LANs 6-9

9

MPLS versus IP paths

- **IP routing:** path to destination determined by destination address alone
- **MPLS routing:** path to destination can be based on source *and* destination address
 - **fast reroute:** precompute backup routes in case of link failure

Link Layer and LANs 6-10

10

MPLS signaling

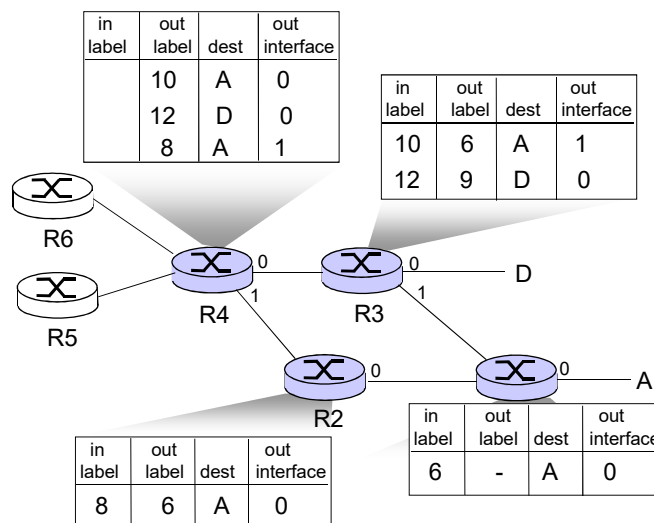

- modify OSPF, IS-IS link-state flooding protocols to carry info used by MPLS routing,
 - e.g., link bandwidth, amount of “reserved” link bandwidth
- entry MPLS router uses *RSVP-TE signaling protocol* to set up MPLS forwarding at downstream routers

Link Layer and LANs 6-11

11

MPLS forwarding tables

Link Layer and LANs 6-12

12

Data center networks

- 10's to 100's of thousands of hosts, often closely coupled, in close proximity:
 - e-business (e.g. Amazon)
 - content-servers (e.g., YouTube, Akamai, Apple, Microsoft)
 - search engines, data mining (e.g., Google)
- challenges:
 - multiple applications, each serving massive numbers of clients
 - managing/balancing load, avoiding processing, networking, data bottlenecks

Inside a 40-ft Microsoft container, Chicago data center

Link Layer and LANs 6-13

13

Data center networks

load balancer: application-layer routing

- receives external client requests
- directs workload within data center
- returns results to external client (hiding data center internals from client)

Link Layer and LANs 6-14

14

Data center networks

- rich interconnection among switches, racks:
 - increased throughput between racks (multiple routing paths possible)
 - increased reliability via redundancy

Link Layer and LANs 6-15

15

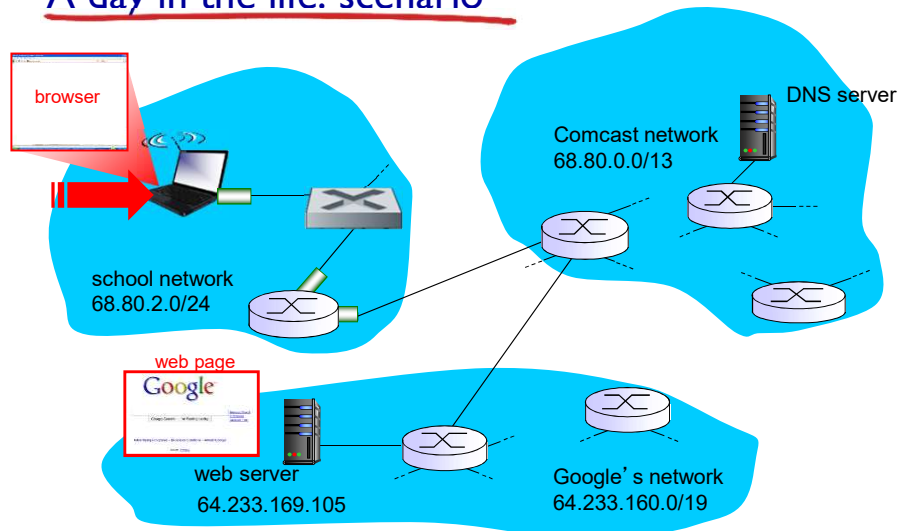

Synthesis: a day in the life of a web request

- journey down protocol stack complete!
 - application, transport, network, link
- putting-it-all-together: synthesis!
 - **goal:** identify, review, understand protocols (at all layers) involved in seemingly simple scenario: requesting www page
 - **scenario:** student attaches laptop to campus network, requests/receives www.google.com

Link Layer and LANs 6-16

16

A day in the life: scenario

Link Layer and LANs 6-17

17

A day in the life... connecting to the Internet

- connecting laptop needs to get its own IP address, addr of first-hop router, addr of DNS server: use **DHCP**
- DHCP request **encapsulated** in **UDP**, encapsulated in **IP**, encapsulated in **802.3** Ethernet
- Ethernet frame **broadcast** (dest: FFFFFFFF) on LAN, received at router running **DHCP** server
- Ethernet **demuxed** to IP demuxed, UDP demuxed to DHCP

Link Layer and LANs 6-18

18

A day in the life... connecting to the Internet

- DHCP server formulates **DHCP ACK** containing client's IP address, IP address of first-hop router for client, name & IP address of DNS server
- encapsulation at DHCP server, frame forwarded (**switch learning**) through LAN, demultiplexing at client
- DHCP client receives DHCP ACK reply

Client now has IP address, knows name & addr of DNS server, IP address of its first-hop router

Link Layer and LANs 6-19

19

A day in the life... ARP (before DNS, before HTTP)

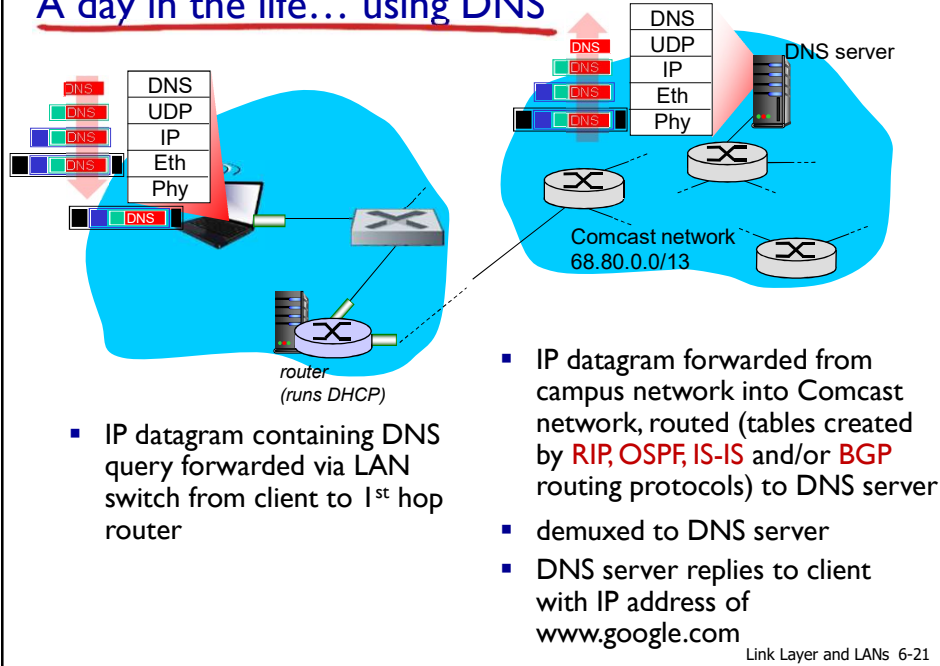

- before sending **HTTP** request, need IP address of **www.google.com**: **DNS**
- DNS query created, encapsulated in UDP, encapsulated in IP, encapsulated in Eth. To send frame to router, need MAC address of router interface: **ARP**
- **ARP query** broadcast, received by router, which replies with **ARP reply** giving MAC address of router interface
- client now knows MAC address of first hop router, so can now send frame containing DNS query

Link Layer and LANs 6-20

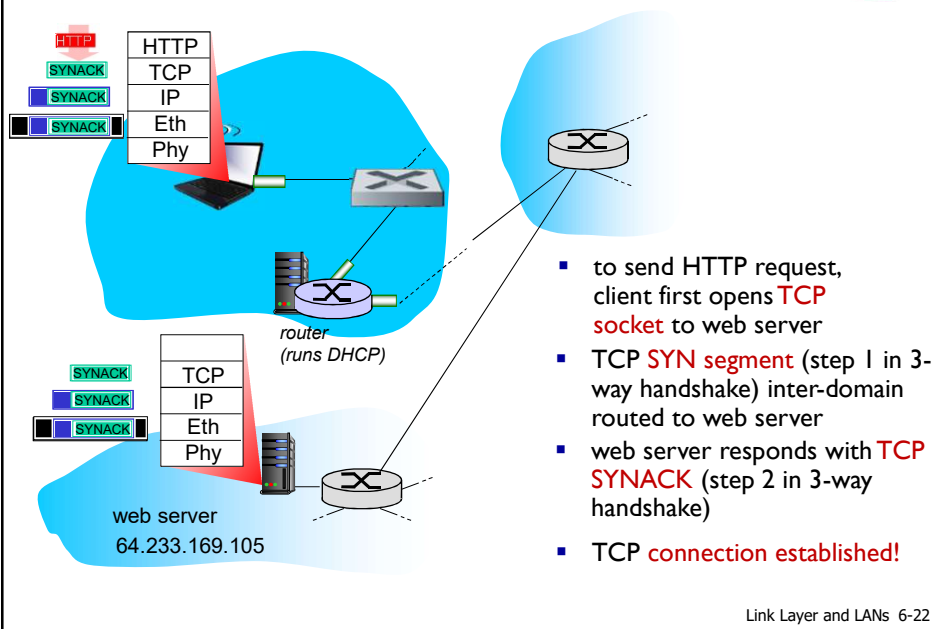

20

A day in the life... using DNS

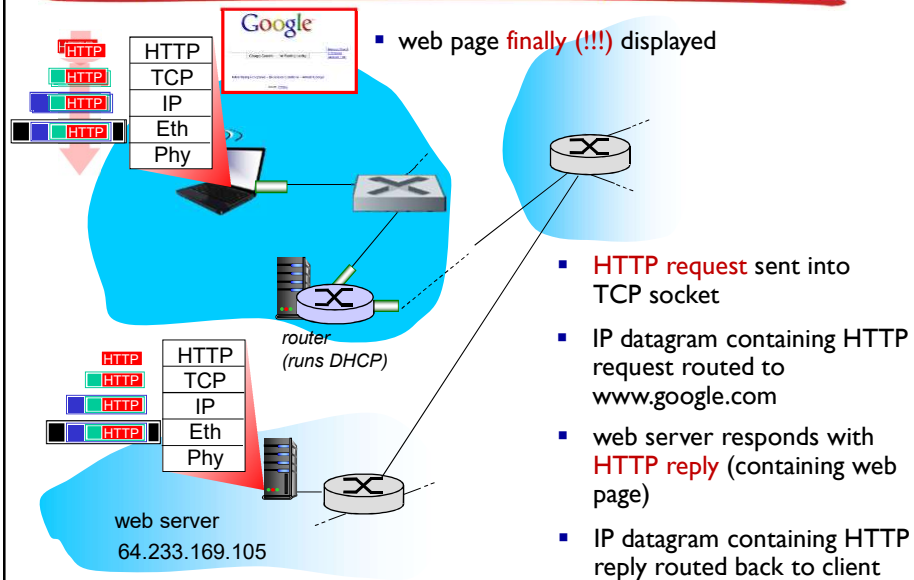

21

A day in the life...TCP connection carrying HTTP

22

A day in the life... HTTP request/reply

Link Layer and LANs 6-23
